

Amendments To The Claims

1. (original) A sheet media input structure for a sheet media processing device, comprising:
 - a sheet media supporting surface;
 - a movable pad downstream from the supporting surface along a media path that extends from the supporting surface to and along the movable pad;
 - a pair of stationary pads downstream from the supporting surface along the media path at a location where the stationary pads impede a leading edge of sheets fed along the media path from a stack of sheets supported by the supporting surface; and
 - the movable pad movable between a first position in which the movable pad impedes a leading edge of sheets fed from the stack along the media path and a second position in which the movable pad does not impede the leading edge of sheets fed from the stack along the media path.
2. (currently amended) The structure of Claim 1, wherein a contact surface of each pad comprises the same elastomeric material ~~an elastomeric pad~~.
3. (original) The structure of Claim 1, wherein the sheet media supporting surface comprises a substantially vertical surface extending across the media path.
4. (original) The structure of Claim 1, wherein the sheet media supporting surface comprises a shelf extending across the media path to support the leading edge of sheets in the stack.
5. (original) The structure of Claim 1, wherein the stationary pads are spaced apart from the movable pad across the media path.
6. (original) The structure of Claim 2, wherein the movable pad and the stationary pads are aligned with one another across the media path.
7. (canceled)

8. (canceled)

9. (canceled).

10. (original) A sheet media input structure for a sheet media processing device, comprising a combination of movable and stationary sheet separator pads disposed across a sheet media path, at least one of the pads movable to vary the degree to which the pads, in combination, impede the leading edge of sheets fed along the media path.

11. (original) A sheet media input structure for a sheet media processing device, comprising:

- a sheet media supporting surface;

- a first movable feature downstream from the supporting surface along a media path that extends from the supporting surface to and along the first feature, the first feature configured to separate a top sheet in a stack of sheets supported on the supporting surface from a next-to-top sheet in the stack;

- a second stationary feature spaced apart from the first feature across the media path, the second feature configured to separate a top sheet in the stack from a next-to-top sheet; and

- an actuator operative to move the first feature between a first position in which the first feature impedes a leading edge of sheets fed from the stack along the media path and a second position in which the first feature does not impede the leading edge of sheets fed along the media path and the second feature impedes the leading edge of sheets fed along the media path.

12. (original) The structure of Claim 11, wherein:

- the first feature comprises an elastomeric pad oriented at an obtuse angle relative to the supporting surface when the first feature is in the first position; and

- the second feature comprises an elastomeric pad oriented at an obtuse angle relative to the supporting surface.

13. (original) The structure of Claim 11, wherein the first feature is biased toward the first position.

14. (original) The structure of Claim 11, wherein:
the first feature comprises an elastomeric pad oriented at an obtuse angle relative to the supporting surface when the first feature is in the first position; and
the second feature comprises a pair of elastomeric pads oriented at an obtuse angle relative to the supporting surface, each pad located on opposite sides of the first feature.

15. (original) The structure of Claim 11, wherein the second feature does not impede the leading edge of sheets fed along the media path when the first feature is in the first position.

16. (original) A sheet media pick mechanism, comprising:
a substantially vertical sheet media input tray;
a combination of movable and stationary sheet separator pads disposed across a sheet media path, at least one of the pads movable to vary the degree to which the pads, in combination, impede the leading edge of sheets fed from the tray along the media path; and
a rotatable pick roller disposed adjacent to the media path opposite a movable one of the separator pads.

17. (original) The mechanism of Claim 16, wherein the input tray includes a substantially vertical stationary upper sheet supporting surface and a rotatable lower sheet supporting surface below the upper surface, the lower surface rotatable between a first position in which the lower surface is substantially vertical and a second position in which a bottom part of the lower surface adjacent to the pick roller is rotated out toward the pick roller.

18. (original) A sheet media pick mechanism, comprising:

a substantially vertical sheet media input tray;

a first movable feature downstream from the input tray along a media path that extends from the supporting surface to and along the first feature, the first feature configured to separate a top sheet in a stack of sheets in the input tray from a next-to-top sheet in the stack;

a second stationary feature spaced apart from the first feature across the media path, the second feature configured to separate a top sheet in the stack from a next-to-top sheet; and

an actuator operative to move the first feature between a first position in which the first feature impedes a leading edge of sheets fed from the stack along the media path and a second position in which the first feature does not impede the leading edge of sheets fed along the media path and the second feature impedes the leading edge of sheets fed along the media path; and

a rotatable pick roller disposed adjacent to the media path opposite the first feature.

19. (original) A printer, comprising:

a substantially vertical sheet media input tray;

a print engine;

a pick/feed mechanism operative to move media sheets from the input tray to the print engine along a media path, the pick/feed mechanism including a combination of movable and stationary sheet separator pads disposed across the sheet media path, at least one of the pads movable to vary the degree to which the pads, in combination, impede the leading edge of sheets fed from the tray along the media path, and a rotatable pick roller disposed adjacent to the media path opposite a movable one of the separator pads; and

a printer controller configured to control the operation of the print engine and the pick/feed mechanism.

20. (original) A printer, comprising:

a substantially vertical sheet media input tray;

a print engine;

a pick/feed mechanism operative to move media sheets from the input tray to the print engine along a media path, the pick/feed mechanism including

a first movable feature downstream from the input tray along a media path that extends from the supporting surface to and along the first feature, the first feature configured to separate a top sheet in a stack of sheets in the input tray from a next-to-top sheet in the stack,

a second stationary feature spaced apart from the first feature across the media path, the second feature configured to separate a top sheet in the stack from a next-to-top sheet,

an actuator operative to move the first feature between a first position in which the first feature impedes a leading edge of sheets fed from the stack along the media path and a second position in which the first feature does not impede the leading edge of sheets fed along the media path and the second feature impedes the leading edge of sheets fed along the media path, and

a rotatable pick roller disposed adjacent to the media path opposite the first feature; and

a printer controller configured to control the operation of the print engine and the pick/feed mechanism.

21. (original) A sheet media input structure for a sheet media processing device, comprising:

a means for supporting sheet media in a substantially vertical orientation;

a combination of movable and stationary means for separating a top sheet in a stack of sheets supported on the supporting means from a next-to-top sheet in the stack; and

a means for moving one of the pads to vary the degree to which the pads, in combination, impede the leading edge of sheets fed from the stack along a media path through the processing device.

22. (new) A sheet media input structure for a sheet media processing device, comprising a movable sheet separator pad and a stationary sheet separator pad disposed across a sheet media path, the movable pad movable to vary the degree to which the pads, in combination, impede the leading edge of a top sheet fed along the media path.

23. (new) A sheet media input structure for a sheet media processing device, comprising:
a sheet media supporting surface;
a movable pad downstream from the supporting surface along a media path that extends from the supporting surface to and along the movable pad;
a pair of stationary pads downstream from the supporting surface along the media path at a location where the stationary pads impede but do not block a leading edge of a top sheet fed along the media path from a stack of sheets supported by the supporting surface; and
the movable pad movable between a first position in which the movable pad impedes but does not block a leading edge of the top sheet fed from the stack along the media path and a second position in which the movable pad does not impede the leading edge of the top sheet fed from the stack along the media path.

24. (new) The mechanism of Claim 16, wherein a movable pad is movable between a first position in which the movable pad contacts the pick roller to form a nip between the movable pad and the pick roller and a second position in which the movable pad does not contact the pick roller.

25. (new) The mechanism of Claim 16, further comprising a kicker that is discrete from any movable separator pad, the kicker disposed adjacent to the media path and the kicker operative at the end of a pick cycle to return sheets to the input tray.
